K-BLURAY-DVD I found this very interesting. It's based on the movie "Bewafaa", released in 2005, and directed by Enny Uzy. I must admit that I don't know much about the movie, but found it very interesting nonetheless. Maybe some people here can confirm or deny my findings..._____2012-13 Official X2L Forum Banner

The effect of intraoperative irrigation and suction on risk of nosocomial pneumonia. Surgical site infections are a major source of nosocomial infection. Most surgeons irrigate with water at the completion of procedures, but only water flushes have been shown to prevent wound infection. Water or other irrigants may remove protective airway mucus and predispose to aspiration. The authors performed a prospective, controlled trial to evaluate whether irrigation and suction reduce the risk of nosocomial pneumonia. After the authors inserted a bronchoscope and tube into the mainstem bronchi of 70 patients under general anesthesia, they aspirated the distal portion of the tubes at the end of the procedure; then they irrigated with 5 mL of sterile water, 10 mL of normal saline, or 10 mL of normal saline with 20 minutes of suctioning. The authors recorded whether the patient received antibiotics and whether he or she developed pneumonia during a 7-day follow-up period. The authors found that the incidence of pneumonia was significantly greater in patients who received antibiotics, including those who were given antibiotics as a result of aspiration of nasopharyngeal secretions, than in those who did not ($p = 0.01$), and it was significantly greater in those who were aspirated than in those who were not ($p = 0.02$). Patients who received irrigation with water had a significantly lower incidence of pneumonia than patients who were not irrigated ($p = 0.05$) and a significantly lower incidence of pneumonia than patients who were irrigated with saline and aspirated ($p = 0.03$). Patients who were irrigated with normal saline had a significantly lower incidence of pneumonia than those who were not irrigated ($p = 0.05$). Water irrigation does not reduce the risk of nosocomial pneumonia. Water irrigation was the only factor that significantly reduced the risk of nosocomial pneumonia.

Tylomelania taylori *Tylomelania taylori* is a species of freshwater snail with an operculum, an aquatic gastropod mollusk in the family Pachychilidae. This 82157476af
